WASTE HOLDING TANK GAUGE (Toilet or Grey Water)

With remote pump out toilets becoming the norm, it has now become essential to know the level of the holding tank.

The unit works by measuring water pressure above the bottom of the tube. The result is displayed on a gauge because we believe this is the most accurate way of presenting the information and makes it easy to predict the number of days to full. The gauge can be positioned anywhere in the boat as required. There is a choice of the new graphics gauge as shown, with back lighting to enable it to be read in dark corners, or at less cost our Compact gauge.

This warning sign shows when the waste level is high and flashes when the level becomes critical

The sensor is mounted through the top of the tank for safety. The most convenient fixing is through a 3/4 BSP socket to fit a bush in the tank, but where this is not available a rubber bung version is supplied.

The depth of the tank should be specified when ordering, as this will enable us to calibrate your unit and to manufacture the sensor to the correct length.

45mm of space above the tank is needed to accommodate the sensor assembly for the rubber bung version and 65mm for the 3/4 B.S.P. version. Please advise us if height is a problem

Supply required 12-24 volts

PLEASE NOTE :- VERSION REQUIRED MUST BE SPECIFIED WHEN ORDERING
